Abstract

In studying the fauna of cynipid gall wasps of Belgrade and its environs during the period from 1997 to 2016, we recorded a total of 46 species from four tribes (Aylacini, Cynipini, Diastrophini and Diplolepidini) and 12 genera (*Andricus*, 27 species; *Diplolepis*, 5 species; *Cynips*, 3 species; *Neuroterus*, 3 species; *Diastrophus*, 2 species; *Aphelonyx*, 1 species; *Barbotinia*, 1 species; *Biorhiza*, 1 species; *Callirhytis*, 1 species; *Chilaspis*, 1 species; *Dryocosmus*, 1 species; and *Pseudoneuroterus*, 1 species). The following species are here recorded as new for the Serbian fauna of cynipid gall wasps: *Diastrophus mayri* Reinhard, 1876; *D. rubi* (Bouche, 1834); *Andricus aries* (Graud, 1859); *A. conificus* (Hartig, 1834); *A. gallaeurnaeformis* (Boyer de Fonscolombe, 1832); *A. grossulariae* Graud, 1859; *A. inflator* Hartig, 1840; *A. superfetationis* (Graud, 1859); *Callirhytis glandium* (Graud, 1859); and *Chilaspis nitida* (Graud, 1859). For all the recorded species, we give the localities, dates and hosts on which they were found in Belgrade and its environs.

KEYWORDS: Serbia, gall wasps, Cynipidae, *Quercus*, *Rosa*, *Papaver*, *Potentilla*, *Rubus*

Introduction

With about 1400 species, cynipid gall wasps are one of the largest family of gall-forming insects in the world. In Europe, North Africa and Asia Minor, they are present with about 120 species (Melika *et al.*, 2000; Csóka *et al.*, 2005), many of which have been recorded in Serbia (Langhoffer, 1915; Baudyš, 1928; Pal, 1983a, 1983b; Mihajlović & Marković, 2003; Glavendekić & Mihajlović, 2004; Marković & Stojanović, 2007, 2009; Drekić, 2006; Marković, 2014, 2015; Stojanović & Marković, 2016). However, it still cannot be said that they have been thoroughly investigated in Serbia, which is why they have been studied here fairly often over the

past 20 years (Marković, 2014, 2015; Stojanović & Marković, 2016). The species found in Belgrade and its environs during these investigations are given in the present paper.

Materials and Methods

The fauna of cynipid gall wasps was investigated during the period from 1997 to 2016 at the following 24 localities in Belgrade and its environs (in most cases given in Serbian without translation to avoid confusion): Ada Ciganlija (44°47' N, 20°24'); arboretum of the Faculty of Forestry (44°46' N, 20°25' E); Banjička Šuma 44°45' N, 20°28' E); Banovo Brdo – park on Požeška street (44°46' N, 20°25' E); Banovo Brdo (44°46' N, 20°25' E); Čukarička Padina (44°46' N, 20°23' E); Clinical Hospital Center KBC "Bežanijska Kosa" (44°49' N, 20°22' E); Košutnjak (44°45' N, 20°26' E); Lipovička Šuma (44°38' N, 20°27' E); Miljakovačka Šuma (44°44' N, 20°27' E); Novo Bežanijsko Groblje (44°48' N, 20°21' E); Ostružnica (44°43' N, 20°19' E); Pionirski Park (44°48' N, 20°27' E); Sajmište (44°47' N, 20°25' E); Sports Center "11 April" (44°45' N, 20°25' E); Sremčica (44°40' N, 20°24' E); Studentski Grad (44°49' N, 20°23' E); Topčiderski Park (44°46' N, 20°26' E); Topčidersko Groblje (44°46' N, 20°26' E); Ušće (44°48' N, 20°26' E); Veliki Mokri Lug – Stepin Gaj (44°44' N, 20°31' E); Veliko Ratno Ostrvo (44°49' N, 20°25' E); Vinča (44°46' N, 20°36' E); and Železnik (44°43' N, 20°22' E). The galls of different species of cynipid gall wasps were collected at each of these localities. After being brought into the Laboratory of Entomology of Belgrade University's Faculty of Forestry, a smaller number of galls were herbarized, identified and deposited in the herbarium of zoococcidia located in the same institution. Another batch of galls was put in photoelectors to obtain imagoes of the cynipid gall wasps. During the period of imago flight, the photoelectors were inspected daily and the emerging imagoes were collected, killed with ether and mounted.

All the obtained imagoes of cynipid gall wasps are housed in the insect collection of the Department of Forest Protection.

The collected galls and obtained imagoes were identified by Č. Marković and A. Stojanović using the published works of Ionescu (1957), Eady & Quinlan (1963), Ambrus (1974), Zerova *et al.* (1988), Csóka (2005), Melika (2006a, 2006b), Ács *et al.* (2007) and Melika *et al.* (2010).

Results and Discussion

In Serbia, oak woods are the commonest type of forests at elevations like that of Belgrade (132 m above sea level on average). Since most of the cynipid gall wasps are trophically linked with oaks (*Quercus* spp.), it is not surprising that these insects occur frequently on the territory of Belgrade, many of them being widely distributed there. Unfortunately, they were not faunistically studied much in Belgrade and its environs prior to the start of the present investigations. According to published data (Baudyš, 1928; Drekić, 2006), only four species of cynipid gall wasps had been recorded up to that time in Belgrade.

During investigating the fauna of cynipid gall wasps in Belgrade and its environs, we recorded a total of 46 species from four tribes (Aylacini, Cynipini, Diastrophini and Diplolepidini) and 12 genera (*Andricus*, 27 species; *Diplolepis*, 5 species; *Cynips*, 3 species; *Neuroterus*, 3 species; *Diastrophus*, 2 species; *Aphelonyx*, 1 species; *Barbotinia*, 1 species; *Biorrhiza*, 1 species; *Callirhytis*, 1 species; *Chilaspis*, 1 species; *Dryocosmus*, 1 species; and *Pseudoneuroterus*, 1 species). The following 10 species are recorded here as new for the Serbian fauna of cynipid gall wasps: *Diastrophus mayri* Reinhard; *D. rubi* (Bouche);

Andricus aries (Giraud); *A. conificus* (Hartig); *A. gallaeurnaeformis* (Boyer de Fonscolombe); *A. grossulariae* Giraud; *A. inflator* Hartig; *A. superfetationis* (Giraud); *Callirhytis glandium* (Giraud); and *Chilaspis nitida*. In addition, the following species are recorded as new for the cynipid gall wasp fauna of Serbia outside of Vojvodina (the northern part of the country): *A. hungaricus* (Hartig); and *Diplolepis mayri* (Schlechtendal) (Langhoffer, 1915; Baudyš, 1928; Pal, 1983a, 1983b; Mihajlović & Marković, 2003; Glavendekić & Mihajlović, 2004; Marković & Stojanović, 2007, 2009; Drekić, 2006; Marković, 2014, 2015; Stojanović & Marković, 2016).

From the trophic point of view, we found the greatest number of cynipid gall wasps on *Quercus robur* L. (20 species); a somewhat smaller number on *Q. frainetto* Ten. (15 species) and *Q. virgiliana* (Ten.) Ten. (14 species); and the smallest number on *Q. cerris* L. (8 species), *Q. petraea* (Matt.) Liebl (6 species), *Rosa* spp. (5 species), *Papaver* sp. (1 species), *Potentilla argentea* L. (1 species) and *Rubus hirtus* Waldst. & Kit. (1 species). Viewed faunistically, it can be said that nearly all the species recorded on the territory of Belgrade could be expected, since they have been previously found in neighboring countries (Langhoffer, 1915; Ionescu, 1957; Melika et al., 2000; Kwast, 2012). That many of them are new for the Serbian fauna of cynipid gall wasps can be attributed to the fact that these insects were very little studied in Serbia in the past.

If we compare the results of the present investigations and those of Langhoffer (1915), Baudyš (1928), Pal (1983a, 1983b), Mihajlović & Marković (2003), Glavendekić & Mihajlović (2004), Marković & Stojanović (2007, 2009), Drekić (2006), Marković (2014, 2015) and Stojanović & Marković (2016), we can easily see that the territory of Belgrade, with a total of 46 species found to date, is the region of Serbia with the most species of cynipid gall wasps.

The list that follows includes all species of cynipid gall wasps whose presence on the territory of Belgrade was confirmed in our investigations. The list gives the localities, dates and food plants on which individual species of these insects were recorded. For each species, the list also cites the generation (sexual, asexual) whose galls were found. The species names used in the list are matched to the names reported for species of cynipid gall wasps in the Melika papers (2006a, 2006b).

The list of recorded species of cynipid gall wasps

Tribe Aylacini

Barbotinia oraniensis (Barbotin, 1964)

Asexual generation gall in the fruit capsule: Bežanijska Kosa 04.06.2016 *Papaver* sp.

Tribe Cynipini

Andricus amblycerus (Giraud, 1859)

Asexual generation bud galls: Košutnjak 16.01.1999, 23.7.2007 *Quercus* sp., Lipovička Šuma 17.06.2011 *Q. frainetto*, Miljakovačka Šuma 21.07.2012 *Q. frainetto*.

A. aries (Giraud, 1859)

ПРИЛОГ ПРОУЧАВАЊУ ФАУНЕ ГАЛИКОЛНИХ СҮНИПИДАЕ (HYMENOPTERA, СҮНИПИДАЕ) НА ПОДРУЧЈУ БЕОГРАДА (СРБИЈА)

ЧЕДОМИР МАРКОВИЋ и АЛЕКСАНДАР СТОЈАНОВИЋ

Извод

Проучавањем фауне галиколних Cynipidae Београда и његове околине у периоду од 1997. до 2016. године констатовано је укупно 46 врста из 4 трибуса (Aylacini, Cynipini, Diastrophini, Diplolepidini) и 12 родова (*Andricus* 27 врста, *Diplolepis* 5, *Cynips* 3, *Neuroterus* 3, *Diastrophus* 2, *Aphelonyx* 1, *Barbotinia* 1, *Biorhiza* 1, *Callirhytis* 1, *Chilaspis* 1, *Dryocosmus* 1, *Pseudoneuroterus* 1). По први пут за фауну галиколних Cynipidae Србије пронађене су врсте *Diastrophus mayri* Reinhard, 1876, *D. rubi* (Bouché, 1834), *Andricus aries* (Giraud, 1859), *A. conificus* (Hartig, 1843), *A. gallaeurnaeformis* (Boyer de Fonscolombe, 1832), *A. grossulariae* Giraud, 1859, *A. inflator* Hartig, 1840, *A. superfetationis* (Giraud, 1859), *Callirhytis glandium* (Giraud, 1859) и *Chilaspis nitida* (Giraud, 1859). За све констатоване врсте у раду су наведени локалитети, датуми и домаћини на којима су оне у Београду и његовој околини пронађене.
